

Using tablets for waterline compliance may come at a cost to your practice

The disadvantages of using tablets add up

- **\$821/year for just one operatory***: Approximate cost for following tablet instructions for use (IFU)
- **Shocking and monitoring**: Required procedures included in ALL tablet IFUs
- Necessary to maintain compliant CFU counts
- **Staff time and expense** to manage daily tablet use as well as shocking and monitoring procedures per IFUs
- **Tablets must be added at every water change** and given the proper time to dissolve
- Potential risk of staff **daily exposure to chemicals**
- **Service technician calls may increase** due to a gradual buildup of tablet residue and undissolved tablets potentially blocking connections and narrow passageways. Tablet residue and undissolved tablets may also adversely affect expensive handpieces over time.
